Homo sapiens EST sequence. This sequence was generated as part of
The Wellcome Trust Sanger Institute program to identify and
annotate genes in the human genome. Incomplete or unconfirmed genes
are experimentally analysed using a variety of CDNA library
resources. This sequence was obtained from a PCR product generated
from a pool of up to 100,000 cDNA clones derived from
pool of up to 100,000 cDNA clones derived from

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description
                                                                                                                                                                                                                                                                                                                                                                                      1353

Patent No. 6506607

GENERAL INFORMATION:
ADDITIONAL AND ADDITION AND ASSESSMENT
TITLE OF INVENTION: METHODS AND COMPOSITONS FOR THE IDENTIFICATION AND ASSESSMENT
TITLE OF INVENTION: OF PROSTATE CANCER THERAPIES AND THE DIAGNOSIS OF PROSTATE CANCER
FILE REFERENCE: 07344-074001
CURRENT APPLICATION NUMBER: US/09/220,132
CURRENT APPLICATION NUMBER: US 60/079,303
PRIOR PILING DATE: 1998-03-25
PRIOR PILING DATE: 1998-12-24
NUMBER OF SEQ ID NOS: 191
NUMBER OF SEQ ID NOS: 191
NUMBER OF SEQ ID NOS: 191
NUMBER OF SEG ID NOS: 191
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1014
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1075 TTTGGAAACCCAAGAGGTACCTTTCTTATCCGCGAGAGTGAAACCACCAAGGTGCCTAT 1134

Patent No. 6655938

GRUBEAL INFORMATION:

APPLICANT: CHERESH, David A.

APPLICANT: ELICEIRI, Brian

TITLE OF INVENTION: METHODS AND COMPOSITIONS USEFUL FOR MODULATION OF

TITLE OF INVENTION: AND TOGRENESS AND VASCULAR PERMEABILITY USING SRC OR

TITLE OF INVENTION: YES TYROSINE KINASES

FILE REPERBENCE: TSRI 651.2

CURRENT APPLICATION NUMBER: US/09/470,881

CURRENT FILING DATE: 1999-05-28

PRIOR FILING DATE: 1999-05-28

PRIOR FILING DATE: 1999-05-29

PRIOR FILING DATE: 1998-05-29
                                                                                                                                                                                                                                                                                                                                                          1255 CAGCTIGIACAACATACICAGAGAGAGGCIGCAGGTCTCIGCIGCCIAGTAGTICCC 1314

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                          Sequence 77, Application PC/TUS9306251
GENERAL INFORMATION:
APPLICANT: Wickstrom, Eric and Rife, Jason P.
TITLE OF INVENTION: Trivalent Synthesis of Oligonucleotides Containing
TITLE OF INVENTION: Stereospecific Alkylphosphonates and Arylphosphonates
NUMBER OF SEQUENCES: 93
CORRESPONDENCE ADDRESS:
ADDRESSER: SCULLY, SCOTT, MURPHY & PRESSER
STREET: 400 Garden City Plaza
CITY: Garden City Plaza
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  895 GGAGAAAATTTCAAATATTGAACAGCTCGGAAGGAGATTGGTGGGAAGCCCGCTCCTTG 954

```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
Human DNA sequence from clone RP3-460J8 on chromosome C2041.21-11.23 Contains the 3' end of the gene for a novel protein similar to N-myc downstream regulated (NDRG1) the 5' end of a gene encoding a novel protein tyrosine kinase, ESTs, STSs and GSSs,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Submitted (23-JUL-2001) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk requests: clonerequest@sanger.ac.uk clone on Aug 7, 2000 this sequence version replaced gi:6425549.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

gene
corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 20, constructed by the Sanger Centre Chromosome 20 http://www.sanger.ac.uk/HGP/Chr20

IMPORTANT: This sequence by the Sanger Centre Chromosome 20 http://www.sanger.ac.uk/HGP/Chr20

IMPORTANT: This sequence is not the entire insert of clone RP3-460J8 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap.

The true left end of clone RP3-469A13 is at 100 in this sequence. The true right end of clone RP3-460J8 is at 66741 in this sequence. The true left end of clone RP3-469A13 is at 100 in this sequence. The true left end of clone RP3-460J8 is at 100 in this sequence. This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality as as compressions and repeats; all regions were covered by high quality data (i.e., phred quality as segembly was confirmed by restriction digest. RP3-460J8 is from the firther definited by restriction digest. RP3-460J8 is from the firther definited by the group of Pieter de Jong. For

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Quality: Phrap Quality >=40 99.5% of Sequence;
Estimated Total Number of Brrors is 0.4.

NOTE: This insert is not the entire sequence of the clone (entire sequence is 147.2kb). It is clipped at the overlap with AC010237.
The number of bases overlapped is 38259.

Quality coverage: 18.4 in Q20 bases; sum-of-contigs estimation.
* NOTE: This is a 'working draft' sequence. It currently
* consists of 5 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

New polypeptides for treating or preventing a disorder associated with them, in humans, e.g. cardiomyopathy, atherosclerosis or cancers.

Example 2; Page 234; 263pp; English.

The invention relates to an isolated polypeptide (NOVX) a mature form of NOVX, a NOVX variant (differing by no more than 15%), the nucleotide

```
encoding NoVX (or its complement, fragment or variant). NoVX is NoV1-14, 154, 155, 163, and 16b. The NoVX polypeptide, nucleic acid encoding it and antibody against it, are useful for treating or preventing (e.g. by gene therapy) a NoVX-associated disorder in humans, e.g. cardiomyopathy, attentional conference or cancers. The NoVX polypeptide are tabolic pathway modulation, diabetes or cancers. The NoVX polypeptide are and nucleic acids are also useful for determining the presence of predisposition to the diseases. The NoVX nucleic applications for predisposition to the diseases. The NoVX nucleic applications for especially useful in therapeutic or prophylactic applications for disorders associated with aberrant NoVX expression or activity, e.g. cancers (e.g. adenocarcinoma, lymphoma, prostate cancer or uterus cancer), immune response, graft-versus-host disease, acquired immunodeficiency syndrome (AIDS), asthma, Crohn's disease, hypertension, congenital heart defects, multiple sclerosis, inflammation or Albright hereditary osteodystrophy and many other diseases listed in the specification. The DNA encoding the protein is useful in gene therapy for treating the conditions. This is also useful in detection assays, or for developing a powerful assay system for functional analysis of various human disorders, as well as in diagnostic or prognostic assays, or human disorders, as well as in diagnostic spilications. The present sequence is a reverse transcriptase (RT)-PCR primer used to measure treature.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 20 BP; 3 A; 3 C; 8 G; 6 T; 0 U; 0 Other;

New polypeptide designated ORFX are present in human atherogenic cells and are useful to prevent and treat ORFX-associated disorders including

```
ö
                                                                                          The present invention relates to novel human ORFX polypeptides and their coding sequences (ABR63611-ABP64681 and ABD69819-4-AB099567). The sequences were discovered in human atherogenic cells, in particular in platelets and human umbilical vein endothelial cells (HUVEC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX associated discorder, e.g. cancer, cardiovascular disease, allery, autoimmune disease, wound healing, blood coagulation disorders or inflammatory disorders. Note: The sequence data obtained in electronic forms directly from the USPTO web site at sequence. Luspto.gov/sequence.html?PocID=20020082206
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, chromosome mapping, gene mapping, gene therapy, forensic; food supplement, medical imaging, diagnostic, genetic disorder;

genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) iss useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful In medical imaging of bites expressing (II). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Ab564197-Ab54564 represent novel human diagnostic coding sequences. Ab564197-Ab54564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this electronic format directly from MPD at the printed appearation, but was obtained in electronic format directly from MPD at the wippoint whip of the wippoint appearation and port sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated polypeptide (NOVX) a mature form of NOVX. As NOVX variant (differing by no moore than 15%), the nucleotide encoding NOVX (or its complement, fragment or variant). NOVX is NOV1-14, 15a, 15b, 16a, and 16b. The NOVX polypeptide, nucleic acid encoding it
coding sequences (ABP63631-ABP64681 and ABQ98194-ABQ99267). The sequence were discovered in human atherogenic cells, in particular in platelets and human unbilical vein endothelial cells in particular in platelets and human unbilical vein endothelial cells (HUVEC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and mucleic acids are useful for treating or preventing a pathological condition associated with an ORFX-associated disorder, e.g. cancer, cardiovascular disease, allergy, autoimmune disease, wound healing, bloo coagulation disorders or inflammatory disorders. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site at sequence.html?DocID=20020082206
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptides for treating or preventing a disorder associated with them, in humans, e.g. cardiomyopathy, atherosclerosis or cancers.

gene therapy) a NOVA-associated disorder in humans, e.g. cardiomyopathy, at the condition disborder in humans, e.g. cardiomyopathy, and associated disorder in humans, e.g. cardiomyopathy, metabolic pathway modulation, disborder to cancers. The NOVA polypeptide and mucleic acids are also useful for determining the presence of predisposition to the diseases. The NOVA nucleic acid and polypeptide are especially useful in therapeutic or prophylactic applications for disorders associated with aberrant NOVA expression or activity, e.g. cancers (e.g. adenocarcinoma, lymphoma, prostate cancer or uterus cancer), immune response, graft-versus-host disease, acquired immunodeficiency syndrome (AIDS), asthma, Crohn's disease, hypertension, eongenital heart defects, multiple sclerosis, inflammation or Albright hereditary osteodystrophy and many other diseases listed in the specification. The DNA encoding the protein is useful in gene therapy for treating the conditions. This is also useful in detection assays,

```
The invention relates to a substantially purified human SH2/SH3-domain-
Containing adapter polypeptide, termed Src-Like Adapter Protein-2 (SLAP-
2): The invention is useful for treating an immune disorder involving
hyperactivity of B- or T-lymphocytes in a mammal. The invention is
useful for screening for antagonists or inhibitors of the interaction of
hSLAP-2 with cellular signalling compounds, for diagnosing, treating or
preventing diseases or disorders associated with aberrant or uncontrolled
cellular signal transduction, for determining those cellular signalling
molecules which associate with hSLAP-2 and which provide critical signals
or cell activation, and as effectors in methods to affect T- cell
cor cell activation, and as effectors in methods to affect T- cell
cortivation. The invention is useful in screening assays to identity and
detect candidate bloactive agents that modulate hSLAP-2 bloactivity, for
ptential use to treat autoimmune diseases which may be caused by
conditions, diseases, or disorders, T-cell and B-cell neoplasms, conditions, diseases, or disorders, T-cell and Conditions, Theumatoid arthitis,
conditions, diseases, or disorders, T-cell and Conditions, theumatoid arthitis,

The invention relates to a novel DNA sequence comprising any one of 74 sequences with promoter activity, having a fully defined sequence shown in the specification or having a sequence which hybridised under stringent conditions to one of the 74 sequences. The invention further comprises one of the 74 DNA sequences or their DNA fragments, derived from filamentous fungi Aspergillus genus, being useful for manufacturing a protein. One of the DNA sequences or their branches an effectively activate transcription of a gene encoding a target protein irrespective of the presence or absence of glucose. The DNA sequences and their fargments can constantly activate gene transcription. This polymucleotide sequence represents one of the 74 filamentous fungi Aspergillus genus DNA sequences of the invention.

Detection of expression of specific Aspergillus genes for monitoring the fermentation and growth conditions of the fungus, using DNA probes.

Claim 1; SEQ ID NO 5422; 48pp + Sequence Listing; Japanese

The invention relates to a polynucleotide having any of 6006 specific sequences (ABSC6898-ABSE6893), which are expressed by a fungus under specific culture conditions including one or more of eutrophic, olid, early germination, alkaline, high temperature, low temperature or maltose ulture or polynucleotides stringently hybridising to these sequences. The polynucleotides are useful for monitoring the progress of fermentation and the growth conditions of a fungus, especially of Aspergillus oryzae which is widely used in industrial fermentation. Also monitoring for fungal contamination. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

Claim 88; Page 2863-2864; 3161pp; English.

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of genes in a first filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTS care used in the methods for monitoring differential expression of genes con a first filamentous fungal (FF) cell relative to expression of genes in a first filamentous fungal (FF) cell relative to expression of the expression of genes from FF cells allows the production potential cof the microorganisms to be improved. New genes may be discovered, one spible functions of unknown open reading frames can be identified and copen number variation and stability can be monitored. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, cor catabolic pathway engineering. Using ESTS provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, products to facilitate analysis of the results. The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising a CA nucleic acid, a polypeptide (especially an antibody) that specifically binds to the protein, and a blochip comprising CA nucleic acid, or fragments thereof. The sequences of the invention were identified using oncogenic retroviruses, which insert into the genome of the host organism or a random. Many of these do not carry transduced host oncogenes or pathogenic trans-acting viral genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host protoncogenes. The CA nucleic acid sequences can be used to diagnose carcinoma (especially breast cancer, prostate cancer, lymphoma or leukaemia) or a propensity to carcinoma by determination of the sequence of a nucleic acids, proteins and antibodies are also useful as therapeutic agents and in screening and evaluating drug candidates. The present sequence of the invention. Note: The complete sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New recombinant nucleic acid encoding carcinoma associated protein, useful for preparing compositions for treating carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 44325 BP; 11218 A; 9675 C; 9902 G; 13530 T; 0 U; 0 Other;

New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                              New recombinant nucleic acid comprising a nucleotide sequence of any of the carcinoma-associated (CA) genes, useful for screening for drug candidates for diagnosing or treating carcinomas.
                                                                                                                                                                                                                     The invention relates to a recombinant nucleic acid comprising a nucleotide sequence selected from any of the fully defined carcinomassociated (CA) genes from the 50 tables given in the specification. The CA proteins are secreted, transmembrane or intracellular proteins. The recombinant nucleic acids are useful for screening for drug candidates for diagnosing or treating carcinomas. Sequences given in ADC85215-ADC85514 represent CA genes of the invention.
                                                                                                                                                                                                                                                                                                                                         Sequence 44325 BP; 11218 A; 9675 C; 9902 G; 13530 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, ds, gene; pain, neuronal tissue; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence selected from any of the 660 sequences fully defined activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polypeptides are useful for treating carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and sarcomas. The present sequence represents a human gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; gene therapy; vaccine; cancer; carcinoma-associated gene; CA; secreted; transmembrane; intracellular; ds.

or human polymucleotides or application to the mucleic acid sequence. Also caliente restriction of the nucleic acid sequence. Also comprising the vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide, a host cell comprising the vector, amethod for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a subjected to pain and a subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a method for identifying a compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity of one or more of the polymucleotides of the compound that method for identifying a compound or small molecule that regulates the activity of one or more of the polympetides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polympetides or their antibodies. The polymucleotides or their activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (CUI) and spared nerve injury (CUI) and spared nerve injury (CUI) and spared nerve injury (Mul) and spared nerve injury (Mul) in an animal expense of the polympetides of the invention which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was for this patent did not form part of the printed specification, but were the sequence of the polympetides of the invention of the polympetides prove the sequence of the polympetides of the invention of the polympetides of the invention of the polympetides of
       composition comprising two or more isolated rat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ftp.wipo.int/pub/published_pct_sequences

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, and entrievive or allelic variation'of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a chat is differentially expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that manimal of one or meal molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating control of the invention of pain and a pharmaceutical composition comprising the one or more of the compound that modulates its activity is useful for preparing a medicament for treating collypeptides or their antibodies. The polypeptides of the invention injury (CCI) and spared nerve injury (SM1) in an animal (e.g. spiral segmental nerve injury (SM1) in an animal (e.g. specification) which encodes one of the polypeptides of the invention of the raph, but has patent did not form part of the polypeptides of the invention of the value of the publication of the publication of the publication of the publication of the publication of the publication of the publication of the publication of the publication of the publication of the publication of the publication of the publication of the publication of the publication of New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal. Sequence 2446 BP; 567 A; 637 C; 596 G; 646 T; 0 U; 0 Other; ftp.wipo.int/pub/published_pct_sequences. Claim 1; Page; 1017pp; English.
